1. Report of all findings

The initial step of this investigation involved checking the fingerprints of the artifact files, using *sha256sum file_name*. By doing this we confirmed that our images of the hard drives had not been manipulated.

- **JohnnyDisk.img**

The first step that we did is *mmls johnnyDisk.img*. This command lists all the partition table within that image.

```
(kali@daniel-win11)-[~/johnnyDisk]
$ mmls johnnyDisk.img
GUID Partition Table (EFI)
Offset Sector: 0
Units are in 512-byte sectors

    Slot      Start      End      Length    Description
000:  Meta     0000000000 0000000000 0000000001 Safety Table
001:  -----  0000000000 0000002047 0000002048 Unallocated
002:  Meta     0000000001 0000000001 0000000001 GPT Header
003:  Meta     0000000002 0000000033 0000000032 Partition Table
004:  000      0000002048 0000004095 0000002048
005:  001      0000004096 0052426751 0052422656
006:  -----  0052426752 0052428799 0000002048 Unallocated
```

Figure 1: Output of *mmls johnnyDisk.img*

As we can see, neither slot 000 nor slot 001 has any description. So, we decided to analyze each target partition using the *fsstat* command. The partition that starts at sector offset 2048, we didn't obtain any file system information. But in the root file system, on the partition that starts at sector offset 4096, we obtain the information below about the partition.

```
$ fsstat -o 4096 johnnyDisk.img
FILE SYSTEM INFORMATION

File System Type: Ext4
Volume Name:
Volume ID: df77712f9e08d8e9149527c56cc21fd

```

Figure 2: Output of *fsstat -o 4096 johnnyDisk.img*

After using the **fls** command to list file and directory names from a disk image on that specific partition. We didn't suspect any directory names and files. So, we tried to check if any important files had been deleted using the same **fls** command and adding **-Frd** flag. The output doesn't show any relevant deleted files or directories.

Figure 4: Output of **fls -o 4096 johnnyDisk.img -Frd johnnyDisk.img**

Besides using the **istat** and **icat** commands, we also used **TKF Imager**. We found the hidden artifacts and the files originally discovered in João Musk's sigma account in the below paths:

- root/home/johnnymusk/.cache/thumbnails/normal
- root/home/johnnymusk/.cache/thumbnails/large
- root/home/johnnymusk/Documents
- root/home/johnnymusk/Music

We also found many scripts, that could be evidence of an anti-forensic activities, in the root/home/johnnymusk/s tt

- converter.py (the code converts the input file's content to a binary code and then can read it)
- createChunks.py (the code is used to split the contents of a text file into 3 chunks and save each chunk as a separate file)
- doubleEncodingAndHidingInsideElf.py (the code encrypts the input files information, input_path = '/home/johnnymusk/Documents/hackedcredentials.txt')
- hide_pdf.py (script to hide secret.pdf after the EOF of input.wav)
- cookieSteal.html, exploit.html and exploit.py (with this files content it seems like the attacker want runs in the user's browser and then capturing the user's cookies)
- lsb.pcy (this is a compiled bytecode that shows us the python code is used to encoded diagonally payload in the specific image)

[illegible]

Figure 4: lsb.pcy file

We found many TikTok-like videos and noticed that one of them had been modified (Snapinsta.app_video_0A4741B6D39EC9A52A68DA4898659396_video_dashinit.mp4), so we analyzed it by checking its magic numbers. As its magic number coincided with the mp4 file, it means that this is only a simple video.

Figure 6: Terminal output showing the analysis of the inode where the suspicious video was located

The first secret we had found is the User_Manual.pdf file in the root/home/johnnymusk/Documents. This is a master's thesis document about *Software de telemetria do Ariane 6* by David Alexandre Ferreira da Silva.

In the root/home/johnnymusk/.cache/thumbnails/fail/large path, we found a rocket image (200d463649820c65548b121e4f42ad68.png), we think that it is Ariana 6.

Figure 7: Ariana 6 (200d463649820c65548b121e4f42ad68.png)

In the same folder, we saw an image about IST' study rooms map at TagusPark campus, in the ceaf1f22d9a118942a4f7ad833c36b97.png file.

Figure 8: IST' study rooms map at TagusPark campus

We also uncovered an important IRSSI chat history in the #thebasement.09-26.log file, located in the johnnyDisk/root/home/johnnymusk/snap/irssi/common/irclogs/2024/freenode path, between two users: johnnymusk, who appears to be the student Musk, and RootKitty, whose identity we do not yet know, maybe a colleague of João's.

In the first part of the conversation, RootKitty informs johnnymusk that he/she successfully exploited Fenix and obtained pairs of usernames and passwords using techniques that developed in STT. In the other chat log part, johnnymusk shares a bizarre experience where he received an anonymous email instructing them to retrieve a USB drive hidden near IST. When he did, the USB contained unencrypted files with disturbing information (an Api documentation for a mind control, a blueprint of the Ariane 6 rocket, a bank statement showing a transfer to a man named Virgolino Gonçalves from a company called ERCE.LTA, which was used to buy a mind control component (MKU-2784) from MOBICARE, and Logs suggesting the mind control technology was used to influence people to visit specific restaurants). In the final conversation, the user johnnymusk decided to encrypt the USB contents in files and share them using the Sigma cluster. They also wanted to organize a protest and push for the satellite to be deactivated.

```

16:38 < RootKitty> Hey João, you're not gonna believe what I managed to pull off. Using a combination of the techniques we use in STT, I was able to exploit Fenix and steal pairs of usernames and passwords.
16:33 < johnnymusk> Wait, seriously? How did you even do that? I've been poking around Fenix for ages and got nowhere!
16:33 < RootKitty> Let's just say experience comes in handy, and I got creative with a few of the methods we've been testing.
16:31 < johnnymusk> You're on another level! I can't believe you pulled it off when I couldn't even scratch the surface. What's your secret?
16:31 < RootKitty> Nice try, but I'm not giving away the whole playbook. I'll send you the credentials, though, so you can see for yourself.
16:32 < johnnymusk> You're a legend. I have to see this! I never thought Fenix could be cracked like that.
16:32 < RootKitty> Yeah, well, don't get too hyped. This stays between us, no need to broadcast it.
16:32 < johnnymusk> Don't worry, I know the rules. I'm just eager to see if those creds really work. You're seriously next-level.
16:33 < RootKitty> Appreciate it, João. Just remember to keep it quiet. We don't need extra eyes on this.
16:33 < johnnymusk> Of course, you can trust me. I wouldn't jeopardize anything. I'm just lucky I got to see how you do this stuff.
16:33 < RootKitty> Good. I'll send you the creds in a bit, and you can check it out for yourself.
16:33 < johnnymusk> I can't wait! Just, uh, make sure this doesn't backfire on us, right? I'll won't take this lightly if the creds get out.
16:34 < RootKitty> I know, João. I've got this under control. You're not at the point where you need to worry about that kind of thing.
16:34 < johnnymusk> Yeah, I trust you. You always know what you're doing. Just send those creds when you're ready, I'm dying to see what you cracked.
16:35 < RootKitty> As promised, here they are: https://we.tl/rVgBd1mfr.
16:36 < RootKitty> You can use the script that we made together to hide the credentials! I had a feeling you would have a use for it soon! Catch you later, João!
16:36 < johnnymusk> Thanks kitty! You're always one step ahead.

17:01 < johnnymusk> RootKitty, you're not gonna believe what just happened. I got this anonymous email telling me to retrieve a USB pen from a hidden spot near IST.
17:01 < johnnymusk> I thought it was some kind of joke, but I went anyway.
17:01 < RootKitty> Seriously?
17:02 < RootKitty> And you actually found it?
17:02 < johnnymusk> Yeah, I found it. When I plugged it into my computer, I discovered a folder with some seriously disturbing information.
17:02 < johnnymusk> No encryption, just right there for anyone to see.
17:02 < RootKitty> Okay, now you've got me intrigued. What was in the folder?
17:02 < johnnymusk> It had a bunch of documents. Among them was the API documentation for a mind control component called MKUtra, showing various parameters used for mind control.
17:03 < johnnymusk> There was also a blueprint of the Ariane 6 rocket, which specifically highlighted the position of the ISTSAT-1 satellite in its payload.
17:03 < johnnymusk> But that's not all. I found a bank statement belonging to someone named Virgolino Gonçalves, showing that he received a massive transfer from a company called ERCE.LTA. He then used that money to make a payment to MOBICARE to purchase a component called MKU-2784.
17:04 < RootKitty> Wait, MKU-2784?
17:04 < RootKitty> That sounds like it could be part of the mind control tech.
17:04 < RootKitty> What else was in the folder?
17:04 < johnnymusk> Exactly what I was thinking. There were also logs showing that this mind control component has been actively used.
17:04 < johnnymusk> The logs indicate it's been influencing people to visit four specific restaurants in the Oeiras area. And, if that wasn't strange enough, there was a DECO report included, showing that those four restaurants particularly Pombalino and Caçola are now super trendy.
17:05 < johnnymusk> Their revenues have almost doubled compared to last year, right after ISTSAT-1 was launched.
17:05 < RootKitty> Hold on, you're telling me the mind control tech is being used to send people to restaurants and boost their business? That's crazy, but it actually sounds like it's all connected. What do you think?
17:05 < johnnymusk> That's exactly what I'm thinking.
17:05 < johnnymusk> I'm convinced it's all linked. The satellite, the MKUtra API, the payment trail from ERCE.LTA to Virgolino and then to MOBICARE for that MKU-2784 component, and the sudden surge in popularity and revenue for those restaurants it all lines up.
17:06 < johnnymusk> The mind control tech is being used to manipulate people and drive them to these specific places.
17:06 < RootKitty> Wow. This is huge.
17:06 < RootKitty> If you're right, we're looking at a direct application of mind control tech being used for profit. What are you going to do with this?
17:07 < johnnymusk> I want to organize a protest and push for the satellite to be deactivated. This kind of technology shouldn't be operational, especially with such invasive and unethical uses.
17:07 < RootKitty> I agree, but we need to present this in a way that grabs attention. How about creating a poster? Something visual that really highlights the key details and gets people questioning what's going on?
17:07 < johnnymusk> That's a solid idea.
17:07 < johnnymusk> A simple poster could definitely help get the word out. I'll start working on it now.
17:08 < RootKitty> Great.
17:08 < RootKitty> Make sure the poster is compelling but not too flashy to avoid raising alarms. We don't want the people behind this to catch on.
17:08 < johnnymusk> Will do.
17:08 < johnnymusk> I'll keep it straightforward and clear, but subtle enough to avoid drawing unwanted attention.
17:09 < johnnymusk> Also, I'll hide the sensitive details in some files using tactics I've learned from CTFs. Then, I'll save them in my private account on the Sigma cluster for safekeeping.
17:09 < RootKitty> Sounds like a good plan. Keeping the sensitive info secure is crucial.
17:09 < johnnymusk> Thanks for the support, RootKitty. The files will be well-protected.
17:09 < RootKitty> Be cautious with this.
17:09 < RootKitty> If the information is accurate, we might be dealing with some powerful people.
17:09 < johnnymusk> I'll be careful. I'll make sure everything is secure.

Figure 9: IRSSI chat history between RootKitty and johnnymusk

Due to the nature of chat history, we began searching for evidence of when the USB was plugged into the computer. We found relevant information in this file /var/log/syslog, where if we search for the usb, we find the times where it was inserted a usb device in the computer, manufacturer, serial number, etc.

```

```

Figure 11: evidence at /media/johnnymusk/72B5-E8E1

Also in the syslog file, we found the creation and running of cron jobs, scheduled to run a script.

```
2024-09-23T19:00:01.356259+01:00 mainframe systemd[1]: Starting sysstat-collect.service - system activity accounting tool...
2024-09-23T19:00:01.358758+01:00 mainframe CRON[6985]: (johnnymusk) CMD (sh ~/backups/backup.sh)
2024-09-23T19:00:01.361372+01:00 mainframe systemd[1]: sysstat-collect.service: Deactivated successfully
```

Figure 12: syslog file

The cron job is shown in /var/spool/cron/crontabs

The screenshot shows a file manager window with a sidebar on the left displaying a tree view of the file system. The main pane shows a file list for the directory /var/spool/cron/crontabs. A file named 'johnnymusk' is selected, showing a size of 2, type of Regular File, and a date modified of 23/09/2024 17:55:56. The content of the file is displayed in a text editor, showing a cron job configuration. The configuration includes a comment about not editing the file, the cron version, and a task to run a backup script at 5 a.m. every week.

```
# DO NOT EDIT THIS FILE - edit the master and reinstall.
# (/tmp/crontab.6ifJI8/crontab installed on Mon Sep 23 18:55:56 2024)
# (Cron version -- $Id: crontab.c,v 2.13 1994/01/17 03:20:37 vixie Exp $)
# Edit this file to introduce tasks to be run by cron.
#
# Each task to run has to be defined through a single line
# indicating with different fields when the task will be run
# and what command to run for the task
#
# To define the time you can provide concrete values for
# minute (m), hour (h), day of month (dom), month (mon),
# and day of week (dow) or use '*' in these fields (for 'any').
#
# Notice that tasks will be started based on the cron's system
# daemon's notion of time and timezones.
#
# Output of the crontab jobs (including errors) is sent through
# email to the user the crontab file belongs to (unless redirected).
#
# For example, you can run a backup of all your user accounts
# at 5 a.m. every week with:
# 0 5 * * 1 tar -zcf /var/backups/home.tgz /home/
#
# For more information see the manual pages of crontab(5) and cron(8)
#
*/10 * * * * sh ~/backups/backup.sh
```

Figure 13: cron job

The backups folder contains 3 files:

- backup.sh – it zips the folder ~/Desktop/TVShows with a password generated with pass_gen.sh and a timestamp of the current date

```
#!/bin/bash

timestamp() {
    date +%s
}

TS=$(timestamp)
USER=johnnymusk
HOST=10.0.2.147
DIR=~
ZIPFILE=backup_${TS}.zip
BACKUP_PASS=$(~/backups/pass_gen.sh $TS)

zip -r --password $BACKUP_PASS $ZIPFILE ~/Desktop/TVShows
rsync -avz -e "ssh -i ~/.ssh/id_rsa" ./$ZIPFILE $USER@$HOST:$DIR
rm $ZIPFILE
```

Figure 14: backup.sh

- pass_gen.sh – Runs the obfuscator
- obfuscator – obfuscated python file

The screenshot displays two panels from a forensic analysis tool. The 'Evidence Tree' on the left shows a hierarchical view of a disk image named 'johnnyDisk.img'. It contains two partitions: 'Partition 1 [1MB]' (unrecognized BIOS Boot) and 'Partition 2 [25597MB]' (NONAME [ext4]). Under Partition 2, a directory tree is visible, including folders like 'bin.usr-is-merged', 'boot', 'cdrom', 'dev', 'etc', 'home', and 'johnnymusk'. The 'backups' folder is highlighted under 'johnnymusk'. The 'File List' panel on the right provides a detailed view of the files within the 'backups' folder. It lists three files: 'backup.sh' (1 KB, Regular File, modified 23/09/2024 20:44:15), 'obfuscator' (1 KB, Regular File, modified 14/09/2024 21:45:33), and 'pass_gen.sh' (1 KB, Regular File, modified 08/10/2024 22:45:28).

Name	Size	Type	Date Modified
backup.sh	1	Regular File	23/09/2024 20:44:15
obfuscator	1	Regular File	14/09/2024 21:45:33
pass_gen.sh	1	Regular File	08/10/2024 22:45:28

Figure 15: contents in the backups folder

To unzip the backup zips found in the backupDisk.img, we needed to find their password.

backup.sh	1	Regular File	23/09/2024
obfuscator	1	Regular File	14/09/2024
pass_gen.sh	1	Regular File	08/10/2024

Figure 16: obfuscator file

As the file above was obfuscated, we had to reconstruct to get a runnable python script. In the file content, we know that it saves the seed in /tmp/seed.txt and in the first run, the seed was simply "1 <password>", so we needed to find this password.

```
78      acacb6e8cdf5613a75320bbe4b00f88c9fbd706590984c122d59b73fe1a00f1d
```

Figure 17: seed.txt

If we found the initial password as the seed, we could generate all the seeds in between the first and the last one (78 generations). If we found a password, but the generation of the 78th seed is not equal to the one in /tmp/seed.txt, the password was incorrect.

```
# Function to generate the next seed from the password
def generate_seed(seed):
    # Convert the password to bytes and hash it using SHA-256
    sha256_hash = hashlib.sha256(seed.encode("utf-8")).hexdigest()
    print(f"SHA-256 hash of the password: {sha256_hash}")
    # next seed

    return sha256_hash
# return next_seed
```

Figure 18: code to generate the next seed

Searching the disk, we found a keylogger file, where it shows the user typed “keepassxc”, which is a password manager, and then typed “ilovemydadthegoat” where that could be the password of keepass.

[illegible]

Figure 19: keylogger file

In /home/johnnymusk there is a file called Passwords.kdbx, where keepass stores all the passwords.

Opening this file online in the keepass website with the password “ilovemydadthegoat”, we found the password of the zips, which is “**TheBiteOf87**”

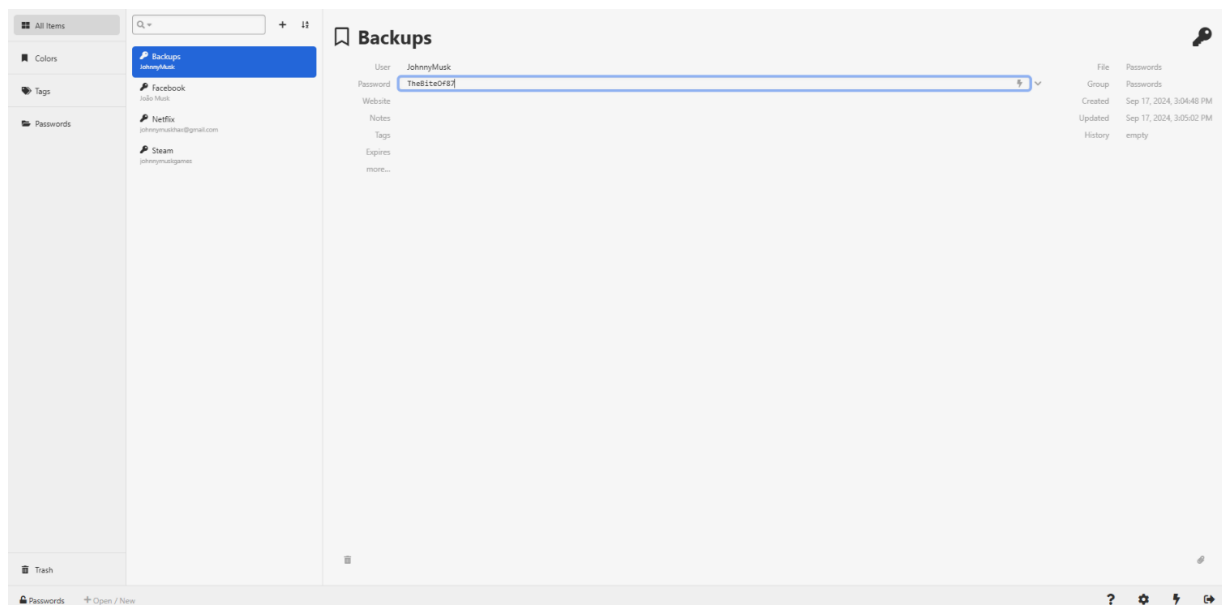

Figure 19: Screenshot showing the password being entered.

To generate the password, the obfuscator appends the timestamp to the seed, so for each zip, we need to test every seed + the zip timestamp found in their name.

```
def create_password(seed, ts):
    combined = seed + ts
    password = hashlib.sha256(combined.encode("utf-8")).hexdigest()
    return password
```

Figure 20: code to create password

```
# Main function that runs the script
def main():
    seed = "TheBiteOf87"

    for i in range(78):
        # Generate the next seed based on the password
        seed = generate_seed(seed)
        print(f"Next seed generated: {i}, {seed}")

        # unzip the backup files with the seed
        zip_ts = [
            "1727365201",
            "1727365801",
            "1727366402",
            "1727367001",
            "1727367601",
            "1727368201",
            "1727368801",
        ]

        for ts in zip_ts:
            extract_folder = f"backup_{ts}"

            # Create the extraction folder if it doesn't exist
            if not os.path.exists(extract_folder):
                os.makedirs(extract_folder)

            try:
                password = create_password(seed, ts)
                with zipfile.ZipFile(f"backup_{ts}.zip", "r") as zip_ref:
                    zip_ref.extractall(path=extract_folder, pwd=bytes(password, "utf-8"))
                    print(f"{f'backup_{ts}.zip'} successfully unzipped with seed gen {i}.")
            except Exception:
                continue
```

Opening all the now unzipped folders, we found all the files from lab1. Many of them also sent the nmap file to ist90834 to 10.0.2.166 which is inside the IP range of the sigma cluster's services.

In the /home/johnnymusk directory, we also have the .bash_history file, where it has all the commands used in the bash terminal. Some important ones are opening the irssi chat, send of files to a remote user via scp (scp -r nmap ist90834@10.0.2.166), opening the usb device, running the anti-forensic python files, etc.

```
irssi
mv ~/Downloads/hackedcredentials.txt ~/Documents
xdg-open ~/Documents/hackedcredentials.txt
rm ~/Desktop/TVShows/
rm -r ~/Desktop/TVShows/
ls
cd Desktop/
ls
cd TVShows/
ls
cd ..
cd stt
ls
nano doubleEncodingAndHidingInsideElf.py
source .venv/bin/activate
python3 doubleEncodingAndHidingInsideElf.py
mv nmap ~/Desktop/TVShows/
cd ~/Desktop/TVShows/
ls
strings nmap
scp -r nmap ist90834@10.0.2.166
scp -r nmap ist90834@10.0.2.166:~
cd /media/johnnymusk/72B5-E8E1
```

Figure 22: .bash_history file

In `/home/johnnymusk/snap/thunderbird/common/.thunderbird/iw2y9jr6.default/Mail/pop.gmail.com` we found the file `Inbox`, with an email sent by `somebodysupercool@protonmail.com` on 26 September 2024.

The `Inbox` file has the email contents encoded in base64, so we created a python script to decode those parts to read the contents of this email.

The sender of this email is talking about the mind control program, MKUltra and where to find a USB with all the information about this project, and to maintain secrecy.

```

Listen up,

I'm dropping this on you because you need to know. There's something big going on—something no one's talking about. Ever heard of MKUltra? It's a mind control program. Sounds crazy, right? Well, it's real, and it's tied to the Ariane-6 project and it is targeting the Oeiras' population.

I've got the proof. Documents, files, the whole deal. This isn't stuff you'll find anywhere else. It's all been kept quiet, but not anymore. I've stashed it for you to check out yourself.

Here's where you can find the USB with everything:
Loc
kerLocky CTT IST Lisboa
Av. Rovisco Pais 1
Postal Code: 1
000-267
Locker 03
Code: 666

Get there, pick up the USB.
It's close to your home and waiting for you. Dig through the files ASAP. But move carefully. This isn't info they want getting out.

```

Figure 25: email contents after decode

The browser history was found in `/home/johnnydisk/snap/firefox/common/.mozilla/firefox/t7pu9ru3.default`, if we run `sqlite3 places.sqlite` we can query the data and save it to a csv.

```

(kali@daniel-win11)-[~/mnt/johnnyDisk/home/johnnymusk/snap/firefox/common/.mozilla/firefox/t7pu9ru3.default]
$ sqlite3 places.sqlite
SQLite version 3.46.0 2024-05-23 13:25:27
Enter ".help" for usage hints.
sqlite> SELECT url, title FROM moz_places;

```

Figure 26: output of sqlite3 places.sqlite

```

Figure 27: history.csv

We found multiple searches of Oeiras restaurants, searches about mind control and hacking tools.

- **backupDisk.img**

The first command that we executed is **mmls backupDisk.img**.

```
(kali@daniel-win11)-[~/backupDisk]
$ mmls backupDisk.img
DOS Partition Table
Offset Sector: 0
Units are in 512-byte sectors
```

	Slot	Start	End	Length	Description
000:	Meta	0000000000	0000000000	0000000001	Primary Table (#0)
001:	-----	0000000000	0000002047	0000002048	Unallocated
002:	000:000	0000002048	0039942143	0039940096	Linux (0x83)
003:	-----	0039942144	0039944191	0000002048	Unallocated
004:	Meta	0039944190	0041940991	0001996802	DOS Extended (0x05)
005:	Meta	0039944190	0039944190	0000000001	Extended Table (#1)
006:	001:000	0039944192	0041940991	0001996800	Linux Swap / Solaris x86 (0x82)
007:	-----	0041940992	0041943039	0000002048	Unallocated

Figure 28: output of mmls backupDisk.img

As we can see here, all of these slots have descriptions. So, we decided to analyze the root partition using the **fsstat -o 2048 backupDisk.img | less** command. The partition that starts at sector offset 2048.

Figure 29: output of fsstat -o 2048 backupDisk.img | less

Using **FTK Imager**, we also found the hidden artifacts and the files originally discovered in João Musk's sigma account in the below paths:

- BackupDisk.img/Partition 1/ext4/root/home/johnnymusk/backup_1727368801.zip
- BackupDisk.img/Partition 1/ext4/root/home/johnnymusk/backup_1727367601.zip
- BackupDisk.img/Partition 1/ext4/root/home/johnnymusk/backup_1727367001.zip
- BackupDisk.img/Partition 1/ext4/root/home/johnnymusk/backup_1727366402.zip
- BackupDisk.img/Partition 1/ext4/root/home/johnnymusk/backup_1727365801.zip
- BackupDisk.img/Partition 1/ext4/root/home/johnnymusk/backup_1727365201.zip

2 Analysis of relevant findings

2.1 Did you find any traces of the hidden artifacts and/or the files originally discovered in João Musk's sigma account on his computers?

Yes, we did. They are located in the folder “backup_1727368201.zip/home/johnnymusk/Desktop/TVShows” as well as in “root/home/johnnymusk/.cache/thumbnails/fail/normal”, “root/home/johnnymusk/.cache/thumbnails/fail/large”, “root/home/johnnymusk/Documents”, “root/home/johnnymusk/Music”.

1. If so, can you trace the origin of these files and how they were processed over time? Construct a timeline of relevant events.

2. Did you uncover any evidence of anti-forensic activities?

Yes, João Musk's backups compressed files in the backup disk image were password protected.

Also, we see in the keylogger log files “johnnyDisk\Partition 2\ext4\[root]\tmp\K5rb9cnL0Is.log” and “johnnyDisk\Partition 2\ext4\[root]\tmp\KFP7oy1K705.log” that he used the command `srm`, which is used for securely deleting files and directories on Unix OS to manipulate the [andromeda.png](#) and [cartwheel.tiff](#) files.

The entire folder on the path “johnnyDisk\ Partition 2\[root]\home\johnnymusk\stt” is comprised of scripts and files used to perform anti-forensic activities, e.g., `exploit.py` and `createChunks.py`.

2.2 What new discoveries can you report that might clarify the plot or identify other relevant actors?

The **User_Manual.pdf**, might indicate that David Alexandre Ferreira da Silva was also possibly involved in the Ariana 6 project. There is another unidentified IST student whose student number is **ist90834**, that appears in multiple backup folders as a log file of connection to address 10.0.2.166, which is one of sigma cluster's server, which could be the person with username **RootKitty** with whom João Musk communicates with in the IRSSI chat room, evidenced by the log file in “johnnyDisk\Partition2\ext4\[root]\home\johnnymusk\snap\irssi\common\irclogs\2024\freemode\#thebasement.09-26.log”. The conversation in this chat indicates that that both of them are against the MK-Ultra program.
